Harvesting honey using anaesthetics

Improved honey market value due to the realisation of its many uses has resulted in many people becoming beekeepers. This has created many problems. Smoking the widely used method of harvesting honey causes veld fires in Africa and exterminates many bees annually. It causes bee absconding and bee hostility. Although some beekeepers are now using smokers instead of lighting a fire, smoke particles in honey reduces its quality and consequently its market prize. Chemical repellents such as propionic anhydride, butyric acid and benzaldehyde sold under trade names bee go, bee quick and bee robber were expected to be a solution to limitations of smoking methods however beekeepers are abandoning them because they are implicated in the pathology of diseases. These challenges are hampering the progress of bee farming and therefore calling for new ways of harvesting honey. This work reports an environmentally and bee friendly way of harvesting honey. The research finding should be interesting to beekeepers and the scientific community.
