

## A Monograph of the Genus *Genlisea*

This work is the first complete monograph of all twenty nine species of *Genlisea* the least understood of all carnivorous plants. Also known as corkscrew plants, *Genlisea* produce complicated, elegant, underground leaves that act as deadly traps to capture and kill micro-organisms. Four years in the making, this pioneering and definitive study examines all aspects of the biology, taxonomy, ecology and diversity of all *Genlisea* species for the very first time. Included in this monograph are many obscure species that have never been photographed or documented before, and one new taxon that is described and introduced in this work for the first time.

Monograph of the Genus *Genlisea* opens with a detailed overview of the carnivorous plants of the world, then examines the discovery and natural history of the genus *Genlisea*. Subsequent chapters then respectively document the vegetative morphology, *Genlisea* trap, generative morphology, ecology and habitats, distribution, and the phylogeny and evolution of the genus. The next chapter covers the taxonomy of the 29 recognised *Genlisea* species over four hundred pages. Each taxon is described in terms of leaf, trap and inflorescence morphology, distribution, habitat and herbarium material and is depicted lavishly through numerous photographs. An extensive chapter documenting the cultivation of *Genlisea* plants is then included, along with an appendix, glossary, bibliography, index and an about the author chapter.
