

Soil acidity is one of the major yield limiting factors to crop production in the highlands of Ethiopia. In order to mitigate this yield limiting factor, a field experiment was conducted to assess the effect of lime and NP fertilizer on yield and yield components on barley (*Hordeum vulgare* L.) at Hagere Selam, Southern Ethiopia. In this book, the combined effects of lime and NP fertilizer on barley crop has been discussed in-depth and the economic feasibility of the strategy has also been elucidated very well. The literature review part is an exhaustive and a brief summary. It provides the extensive in-depth information on acid soil management. In general, this book is a valuable resource for lecturers, graduate and undergraduate students, researchers, and agricultural development workers. It is also a valuable material for others that are engaged in acid soil management projects.
