

Marsupial Nutrition

Marsupial Nutrition describes the food resources used by marsupials from small insectivores to large folivores. It discusses the ways in which these animals digestive systems and metabolism are designed to cope with foods as different as nectar and fungus, tree sap and tough perennial grasses, and insects and eucalypt foliage. Although the subject species are marsupials, the general principles of nutritional ecology and digestive strategies that are introduced at the beginning of the chapters are applicable to all mammals. Advanced undergraduates and graduate students in the areas of vertebrate zoology, nutrition, ecology, and digestive physiology will find Marsupial Nutrition particularly instructive, and wildlife biologists, veterinarians, and nutritionists will also find much of interest.

traditional view is that the BMR of marsupials is about 30% less than that of eutherian (placental) mammals. A BMR for the average marsupial is considered to be 49 kcal or 204 kJ kg^{-0.75} day⁻¹ or 2.33 W kg^{-0.75}. **Buy Marsupial**
