

This is a Ph.D. dissertation. Dementia is a major cause of disability and mortality. The most frequent type of dementia is Alzheimers disease, accounting for about 70% of all dementia cases. Worldwide, about 20 million people suffer from Alzheimers disease. With the increasing number of elderly in the world, Alzheimers disease represents more and more a major health problem with an enormous impact on individuals, families, the health care system, and the society. Therefore, it is imperative that we understand the etiologies, the risk factors and the pathogenic mechanisms involved in Alzheimers disease in order to develop effective treatments that ameliorate or even prevent this illness.
