

Soybean is considered a miracle crop because of its dual qualities, viz., high protein content and oil in seed. In India, the average area under soybean cultivation is 7.71 m ha and the productivity of crop is 1073 kg/ha with total production of 8.27 m t. Even though it is the cheapest high quality vegetable protein, we are yet to exploit its full potential. The excess use of chemical fertilizer spoils the structure of the soil. Therefore, use of chemical fertilizer alone may not keep pace with time in maintenance of soil health for sustaining the crop productivity. Farmyard manure (FYM) and vermicompost are the most important and widely used bulky organic manures, supply plant nutrients including micronutrients, improve soil physical properties and increase availability of nutrients. The importance of potassium in Indian agriculture is increasing with the passage of time. The crop response to application of potassium is becoming more frequent and pronounced. The effect of organic manures and potash on growth yield of soybean under rainfed condition has not yet been tested for this area. To bridge the research gaps highlighted above, the present experiment was carried out.

Eco friendly substance on corrosion behaviour of steel in 1M HCl, Digital Engineers Holds the Future of the Oil and Gas Industry: An Opportunity for Next Gen Engineering Workforce, In Dulci Jubilo, The American ephemeris and nautical almanac (Volume 4), Dont Rock the Boat (Me Too!), London Art Chase (Faithgirlz / Glimmer Girls), A Select Library of Nicene and Post-Nicene Fathers of the Christian Church: Translated Into English With Prolegomena and Explanatory Notes, Hand-Books of Natural Philosophy and Astronomy Volume 1,
